

In Agile, a **Theme** represents the ultimate "north star" goal, an **Initiative** is the broad body of work required to achieve it, and a **Feature** is a specific piece of functionality that delivers distinct value to the user. Here is the Agile language structured for the product development backlog: **The Agile Hierarchy**

How do we make the product stand out

Idea, have both the buttons and a prompt where you can use both.

ERICS NOTES FROM EMAIL

In Agile, a **Theme** represents the ultimate "north star" goal, an **Initiative** is the broad body of work required to achieve it, and a **Feature** is a specific piece of functionality that delivers distinct value to the user. Here is the Agile language structured for the product development backlog: **The Agile Hierarchy**

Theme: Empowering Car Buyers via Intelligent Decision Support

Focus: Leveraging cutting-edge AI technology to level the playing field for everyday consumers, transforming a historically stressful, high-risk purchase into a transparent, confident, and data-backed experience.

Initiative: AI-Driven Market Analysis & Personalized Recommendation Engine

Focus: Developing the core machine learning models, data ingestion pipelines, and user profiling interfaces required to automatically analyze live used car inventory against hyper-specific user preferences.

Feature: Automated Inventory Analysis & Personalized Recommendations

- **Epic Reference:** Core Advisor Core Experience
- **Target Release:** MVP (Minimum Viable Product)

Problem Statement

Used car buyers face severe information asymmetry and high financial risk. They must manually sift through dozens of fragmented inventory websites, decode complex vehicle histories, and try to spot hidden mechanical or pricing red flags. Because most buyers lack automotive expertise, they frequently make uninformed purchases, leading to buyer's remorse and unexpected repair costs.

Customer Solution

We will build an interactive AI Used Car Advisor that acts as a digital co-pilot. The user inputs their unique criteria (budget, lifestyle, reliability tolerance, commute lengths, etc.). The AI instantly scrapes and parses local/national used car inventories, cross-references vehicle histories and model-year reliability data, and delivers a curated "Top 3" recommendation list complete with a transparent, balanced "Pros & Cons" breakdown for each vehicle.

Acceptance Criteria (Given-When-Then Format)

To ensure the development team knows exactly when this feature is successfully built, we use structured **Acceptance Criteria**:

Scenario 1: Inputting Buyer Criteria

- **GIVEN** a user is on the AI Used Car Advisor onboarding page,
- **WHEN** they submit their preferences (e.g., budget, safety ratings, fuel efficiency, cargo space, and geographic radius),
- **THEN** the system must successfully validate the inputs and initialize an active inventory search within 3 seconds.

Scenario 2: Generating Recommendations & Pros/Cons

- **GIVEN** the AI has finished processing active vehicle inventories,
- **WHEN** the results page loads,
- **THEN** the system must display exactly the top 3 vehicle matches, with each match explicitly listing:
 - A percentage-based "Match Score" tailored to the user's criteria.
 - A minimum of 2 automated "Pros" (e.g., *Below market price, Excellent maintenance history*).
 - A minimum of 2 automated "Cons" or risk factors (e.g., *Known transmission issues for this model year, Accident reported in 2023*).

Scenario 3: Handling Zero Inventory Matches

- **GIVEN** a user has entered highly restrictive criteria that yield zero local inventory matches,
- **WHEN** the search executes,
- **THEN** the system must not crash or display a blank screen; instead, it must display a friendly advisory message recommending which specific criteria to loosen (e.g., *"We found no matches within 25 miles. Try expanding your radius to 50 miles or adjusting your price ceiling by \$1,500"*).

To accommodate these exact capabilities, expand Agile structure. Requirements introduce a crucial two-tiered evaluation process: **General Market Data** (macro-level reliability for that specific year/make/model) and **Specific VIN History** (micro-level data for that exact physical car).

Updated Agile **Feature** specification, rewritten to include the exact technical scope, web-scraping dependencies, and UI requirements.

Feature: Dual-Layer AI Scoring & Recommendation Engine

- **Epic Reference:** Core Advisor Matchmaking Engine
- **Target Release:** MVP Phase 1

Problem Statement

Used car buyers struggle to balance macro-level research (Is a 2018 Ford Escape reliable?) with micro-level inspection (Is *this specific* 2018 Ford Escape at Dealer X a good buy?). Combining market reputation, hidden vehicle history reports, dealer reviews, and live pricing requires hours of tabs-open browsing, leading to analytical paralysis and high-risk decision-making.

Customer Solution

The AI Advisor will deploy a two-step analysis pipeline. First, it scrapes internet inventories within the buyer's geographic radius. Second, it calculates a holistic score based on **General Criteria** (make/model/year data) and **Specific VIN Criteria** (the car's actual history). Instead of

just dumping raw data, the AI acts as an actual advisor—delivering up to 5 curated recommendations complete with actionable buying advice, actual vehicle photos, dealer reputations, and plain-English "Why Buy It" vs. "What To Watch For" breakdowns.

Acceptance Criteria (Given-When-Then Format)

Scenario 1: Geographically-Bounded Web Scraping

- **GIVEN** a buyer has submitted their search criteria and a maximum geographic distance (e.g., 50 miles from zip code 90210),
- **WHEN** the AI engine initiates the search,
- **THEN** it must scrape and aggregate live used car web site inventories, filtering out any vehicles located outside the defined mileage radius.

Scenario 2: Calculating the Dual-Layer Vehicle Score

- **GIVEN** a list of candidate vehicles found during the scrape,
- **WHEN** the AI scoring algorithm runs,
- **THEN** it must compute a single, unified "Overall Vehicle Score" composed of:
 1. **General Criterion (50% weight):** Standard pros/cons for that vehicle's manufacture year, make, model, and trimline (e.g., common engine issues, safety ratings).
 2. **Specific VIN Criterion (50% weight):** Private/historical VIN records for that exact vehicle (e.g., number of owners, accident history, open recalls).

Scenario 3: Producing the Top 5 Advice-Driven Results

- **GIVEN** the AI has scored all available inventory,
- **WHEN** presenting the final recommendations to the buyer,
- **THEN** the interface must display a prioritized list of **up to the top 5 vehicles**, and for each vehicle it **must** render:
 - **Visual Content:** Actual photos pulled directly from the source inventory website.
 - **Dealer Metadata:** The Dealer's Name, physical address, and public rating score (e.g., 4.2/5 stars).
 - **Actionable Advice:** Text combining the General and VIN criteria into clear, common-sense blocks labeled **"Why Buy It"** and **"What To Watch For"**.

Technical Tasks & Architecture Notes for the Team

To help your development team implement this, here is the technical breakdown they will look for in the Agile backlog:

- **Data Ingestion Task:** Build web-scraping microservices or integrate APIs (like Edmunds, TrueCar, or Cars.com) to pull live inventory based on geo-coordinates.
- **VIN Integration Task:** Set up secure webhooks/APIs with a vehicle history provider (like Carfax or AutoCheck) to programmatically pull records via VIN instantly.
- **AI Prompt/Logic Task:** Fine-tune the AI model to parse complex data sheets (like a PDF vehicle history report) into conversational, "common-sense" text blocks, specifically preventing robotic, overly technical jargon.

Overview

An exploratory product discussion for **Car Advisor**, a proposed AI-powered tool that helps used-car buyers (rather than dealers) make confident, data-backed purchase decisions. The concept emerged from a real-world use case (helping a family member buy a used car) where existing tools failed to consolidate the needed information.

Deep Dive

This transcript captures an informal brainstorming/development meeting between three participants discussing a new AI-powered application called "Car Advisor." The conversation blends product strategy, technical capabilities, marketing, and personal anecdotes. The meeting has a casual, exploratory tone with significant tangents.

Participants

- Steve Armstrong** (also called "Eric" and other AKAs) — Appears to be the AI/development lead with extensive technical resources
- Ray Mateo** — A long-time colleague/friend (10-15 years connection through Intuit), contributes marketing and product ideas
- Eric/Ian** — A network engineer with a product management background at Broadcom (formerly CA, formerly NetQoS); originated the Car Advisor concept

Note: The names are confusingly applied throughout the transcript, with the speaker referring to "Eric" and "Ian" somewhat interchangeably.

The Market Gap & Value Proposition

- Existing platforms (CarGurus, Carfax, TrueCar) serve **dealers**, not buyers, and are financially disincentivized to flag bad vehicles.
- Differentiator:** A buyer-first tool combining two data layers into a single trust score:
 - Macro data** — year/make/model reliability (e.g., known transmission issues by model year)
 - Micro data** — specific VIN history (accidents, maintenance, recalls, ownership)

- Output: A curated **Top 3–5 recommendations** with plain-English “Why Buy It / What to Watch For” guidance, dealer reputation, and red-flag highlighting.

Key Strategic Decisions & Direction

- **Product framing:** Structured using Agile (Theme → Initiative → Feature) with defined problem statements and acceptance criteria; MVP scope agreed.
- **UI approach:** Hybrid model offering both filter buttons (CarGurus-style) and natural-language prompts.
- **Trust mechanism:** Reputable dealers/private sellers can earn a “stamp of approval”; flag dealers who hide low-quality inventory.

Monetization Options Discussed (Unresolved)

- Free app to drive adoption/social traction, then layer in revenue.
- Sell as a **premium feature/partnership** to Carfax, CarGurus, or AutoCheck (or position for acquisition).
- Advertising (e.g., repair shops), subscriptions, or tools for dealer auction/clearinghouse buyers.
- **Open concern:** Used-car market is low-trust and dealer-funded; clear revenue path not yet identified.

Critical Risk & Proposed Solution

- **Primary hurdle:** Accessing VIN-level history data (Carfax/AutoCheck), which is paid and licensed.
- **Proposed approach:** Reverse-engineer data sources (auction sites, third parties) using AI scraping—similar to prior successes—rather than relying on costly per-report fees (~\$40/report).

Action Items

Owner	Action
Eric	Send Agile-structured PRD, research notes, and car-search documentation to Ian
Ian	Incorporate notes into existing build; test VIN lookup/data scraping using sample VIN
Ian/Team	Produce a short “problem/solution” video commercial by end of week
Ian/Team	Promote app via social channels and outreach programs
Team	Validate ability to source VIN history data without paid subscriptions

Note for Leadership

This is an **early-stage, speculative concept**. The product gap is well-defined and the technical build is progressing, but **monetization strategy and data-access licensing remain unvalidated** and should be resolved before significant further investment.

(Note: The transcript contained extensive informal/tangential discussion of unrelated AI tooling and prior business ventures, which has been excluded as non-material to this initiative.)

Main Themes

1. The Car Advisor Product Concept

The central idea is an **AI-driven tool to help used car buyers**, born from one participant’s real experience helping his granddaughter buy a used car.

The Core Problem Identified:

- Used car buyers face “information asymmetry and high financial risk”
- Existing tools (CarGurus, Carfax, TrueCar) serve **dealers, not buyers**
- A key strategic insight: “Because car listing sites make money by selling user leads to dealerships, they are fundamentally disincentivized to show cons or warn buyers about bad VIN histories.”

The Proposed Solution:

- A “digital co-pilot” that scrapes inventories, analyzes vehicle histories, and provides a curated “Top 3-5” recommendation
- **Dual-layer scoring system:**
 - **Macro-level** (50%): General reliability for the year/make/model
 - **Micro-level** (50%): Specific VIN history for that exact vehicle
- Plain-English “Why Buy It” vs. “What To Watch For” breakdowns

2. Agile Product Framework

Eric/Ian introduced a structured Agile approach to better define the project for AI consumption:

- **Theme:** “Empowering Car Buyers via Intelligent Decision Support” (the North Star)
- **Initiative:** AI-Driven Market Analysis & Personalized Recommendation Engine
- **Feature:** Automated Inventory Analysis & Personalized Recommendations

This was praised as a strong “PRD prompt” that AI could effectively consume.

3. The Monetization Challenge

A recurring concern was “**where’s the money at?**” Multiple models were discussed:

- Selling the solution to CarGurus/Carfax as a **premium feature**
- A **disruption strategy** — building something good enough that a larger company would rather buy it than compete
- Advertising revenue (car repair shops, etc.)

- A freemium model: launch free to gain traction, then monetize via subscriptions
- **Reputable dealer certification** ("stamp of approval")
- Selling tools to used car dealers buying from auction/clearinghouses

Acknowledged Difficulties:

- "Used car dealers are typically unscrupulous"
- "People usually get rid of their cars because there's something wrong"
- The market is dominated by established players with Google relationships

4. The VIN Data Hurdle (Critical Bottleneck)

The biggest identified obstacle was **accessing specific VIN history data**:

- Carfax charges ~\$40/report; AutoCheck ~\$29
- The team discussed **reverse-engineering** data sources (auction sites, DMV titles, third-party sites)
- Confidence was expressed that AI could scrape this freely-available data, citing prior success: "*We reverse engineered what they do and we're able to do it better*" (referencing the "leads please" lead-generation example)

5. Differentiation Features (Brainstormed Ideas)

- **Red-flag highlighting**: Showing which dealers hide problematic inventory
- **Gamification**: Borrowing from a sports-betting analytics app concept
- **Plain-text input** instead of rigid filter buttons ("I want a V4 automatic transmission")
- **Use-case targeting**: e.g., "Show me cars for my 15-year-old new driver"
- **"Private Investigator" feature**: Using AI to call previous owners (sourced via DMV titles), offering gift cards for their experience feedback
- Including **private sellers** alongside dealers

6. Marketing & Outreach Capabilities

- The app is hosted at **caradvisor.noblevision.com** (with caradvisor.ai available)
- Plans to create a **micro-drama commercial** dramatizing the granddaughter car-buying experience (problem → solution format)
- Access to **20,000+ customer emails** for outreach
- A **social media engagement bot system** that auto-interacts with commenters across TikTok, LinkedIn, Instagram, X, and YouTube, with budgets for gift cards and referral bonuses
- Promotion through existing "Go Getter" social channels

Notable Tangents & Side Discussions

AI Capabilities (Recurring Boasts)

The opening and closing feature heavy claims about a newly-released AI model called **"Mythos 1"**:

- "*It's finding zero day exploits that have been around for 20 years, even in the blockchain*"
- Claimed Zcash crashed due to an exploit allowing unlimited coin creation
- Claimed exploits found in BNC Unix (20 years) and NPM (15 years)
- "*We could probably rewrite Windows and Mac OS operating systems from scratch*"
- References to AI agents named after CHiPs TV characters ("Punch and Baker") and Star Wars ("Mandalorian," "Grogu/Mythos")

These claims should be viewed with skepticism given their extraordinary nature.

Personal/Wealth Anecdotes

The speaker shared a story about becoming a millionaire through a Broadcom stock upgrade, calling Eric and Ray with the news, and Ray advising him to sell (advice he didn't take). The framing: "*AI is the new altcoin season... make it while you can.*" He claims working 3 hours of sleep nightly for three years to log "20,000 hours in AI."

Broadcom Business Insight

A substantive industry discussion emerged about Broadcom **discontinuing DX NetOps** and forcing customers into a VCF (private cloud) environment, creating a market opportunity:

- Competitors like SolarWinds or ScienceLogic could capture dissatisfied customers
- A possible on-premises monitoring solution for small-to-mid-sized companies

Notable Quotes

"Because car listing sites make money by selling user leads to dealerships, they are fundamentally disincentivized to show cons or warn buyers about bad VIN histories. By building a tool strictly for the buyer, your product gains an immediate trust advantage..."

"This Hyundai Elantra that was for sale... you should not be walking to go get that car. You should be running." (Gemini's AI response, which they joked about turning into a product feature with "fireworks on the screen")

"You disrupt a company... that they would just rather buy it than compete with you."

"That was their moat because nobody would ever take this much time to do it. But there's no effort with AI."

"AI is the new altcoin season. We're in it for another two years worth of it. And make it while you can."

Action Items

1. **Eric/Ian** will send the Word document (Agile PRD) and the car-search notes to the developer
2. **Developer** will incorporate the Agile structure into the existing app ("it'll overlay" — not start over)
3. **Developer** will produce a **video commercial by end of week** and promote it
4. **Test the VIN data hypothesis** by running the actual purchased car's VIN through the AI to see if it can replicate the Carfax report
5. Research cheaper VIN data sources (AutoCheck reverse-engineering, auction sites, DMV titles)

Assessment

The meeting was **productive in concept generation but lacked focus**, oscillating between concrete product specifications (the well-developed Agile documentation) and grandiose, unverified AI capability claims. The **strongest output** was the structured Agile feature specification (in the meeting notes), which clearly articulates the dual-layer scoring engine, acceptance criteria, and technical architecture. The **weakest area** was monetization clarity and the unresolved critical dependency on VIN history data access. The product idea addresses a genuine market gap (buyer-focused vs. dealer-focused tools), but the team has not yet validated whether they can legally/practically obtain the data that makes the entire concept viable.

Passcode: 966164

AI PM Status Meeting

Time: Jun 9, 2026, 4:30 PM EDT

Duration: 30 minutes

[Join Zoom Meeting](#)

Agenda

- Quick round-robin status update from each of the 3 team members
- Review of all 9 tasks: planned work, priorities, and ownership
- Identify any blockers, dependencies, or risks before work begins
- Confirm today's goals, next steps, and expected deliverables
- Verify timeline alignment and flag any scope or resource concerns

Tasks planned for discussion

- #1 Research AI used-car advisor market (ready, medium) - Eric Custer
- #2 Create Carfax and CarGurus pitch deck (ready, medium)
- #3 Spike Carfax and CarGurus data access (ready, medium)
- #4 Design VIN-based car search prototype (ready, medium)
- #5 Build used-car scoring engine (ready, medium)
- #6 Define premium pricing model (ready, medium)
- #7 Draft product brief and demo script (ready, medium)
- #8 SCRAPE PRIVATE SELLERS (ready, medium)
- #9 ACTUAL PICTURES (ready, medium)

TRANSCRIPT

Ray Mateo, Steve Armstrong. Too many AKAs. Yeah, AKA one of my best friends. So Eric's my best friend, too, right? Hey, Eric. Hey, Ray. You guys may have met before. So when I first became a millionaire, I was doing an upgrade of Broadcom on a Sunday night. And the first person I called was Eric. He was my boss at the time. Nice. And me and Ray go back like 10 years when we were at Intuit. And I was like, what? Way longer than that. I've been here like 15 years already. 15 years, yeah. We've known each other for way long. Go back for a little. And so I think the second call was to Ray Mateo when I first. Yeah. Did he give you the same advice? He probably did. He probably said that I should sell, too. Yeah, I didn't listen. I'm a hard hit. We're here now. AI is the new altcoin season. We're in it for another two years worth of it. And make it while you can. I've been telling Eric, I've been heads down, sleeping only three hours a night. Recently, I changed it to eight hours, which is great. But three hours a night for three years. So I got my 20,000 hours in AI, highest level you can buy on all the accounts. \$2,000 a month expenses, at least for three years. So I think I'm pretty much in a zone right now where we can develop almost anything at this point, especially with Mythos just released a couple hours ago. The new Mythos, it's called, they gave it a different name. But anyway, Mythos 1 is deployed, which is the game changer that can hack anything. It's finding zero day exploits that have been around for 20 years, even in the blockchain. Zcash crashed last week because they found an exploit that you can create unlimited Zcash. Anyway, here we are. Eric has a suggestion. We've done, let me share my screen. Eric did an awesome job. I'm going to share my screen. We did a brainstorming session on a new app called Car Advisor. Well, yeah, it's still a work in progress. But I should say it was more of a casual conversation that we had. And Ian translated a gap that I saw in helping my granddaughter buy a used car. And he saw an opportunity to get AI to fill the gap. So you guys see my screen? Yeah. It is now hosted under Noble Vision, Car Advisor. Oh, now you added a B-roll. Nice. It did it itself. Car Advisor, the link is caradvisor.noblevision.com. Caradvisor.ai is available. So I'm thinking about that. We can literally, me and Ray talked about this a little earlier. We're thinking about making a commercial for you, get some hits. And we also have outreach programs that can outreach to, we have availability of over 20,000 emails of customers that we can get some engagement. And then also, today, I'm trying to get around to it. But we're creating this media outreach, social media commercial generator that will go out and interact with the people who leave comments on our media videos on TikTok, LinkedIn, Instagram, X, or Z, whatever, YouTube. It constantly goes out if people leave. And we ask them to leave comments in the video. If they leave a comment, we engage with them immediately and try to get a social media thing going, like get the community growing by giving our bots a budget to give them gift cards and referral bonuses on all of our applications. So we're just now starting to kick a lot of that off. We've already started with Newfounders, which is another company we're working with. But we're really going to start taking it to the next level. Anyway, so what you've done is awesome. And I've probably finished off some of these. You can see the dashboard under the Car Advisor. I've probably done some of these tasks for you. I've done the actual pictures, scraping private sellers. Well, and what I wanted to do, Ian, was to go backwards a little bit in that email that I sent you to better define the starting point. Because maybe our starting point wasn't as well-defined as... Yeah, we just jumped right in at the end. Yeah, for me, this is kind of like a playground right now. I'm not as far along as you as understanding all of this and trying to

understand how your tools help create this. But like the email I sent you, did you get a chance to look at that, Ian? I'm looking for it now. I could share my screen if you want. Yeah, maybe I got to check my junk. I didn't... Well, here, let me share my screen, if you don't mind. Yeah. Let me... Wait, wait, wait, hold on, hold on. I think I see it. Okay, I'm bringing it up now. Car Advisor. So I was trying to relook at this today using an Agile process, right? And trying to rewrite what we were saying and putting it into an Agile process so that AI can better give us a better starting point than where we were at, if you know what I mean? Yeah, I'm taking notes, too. So here you see in Agile, you see what it says at the top. You know, a theme represents the North Star. An initiative represents the broad body of work. And the feature itself represents the specific pieces of functionality we need to deliver. So I've defined from a high level, I threw together what a theme would be below in red, what the initiative would be. And then if you go down lower, what the feature would be. Now, below that, I have an even more mature feature. Below that feature, the next red section. If you go down to that one instead of this one, go down to the next one. If you go down further to the next red section. Yep. So here, if you read the, so we have a problem statement, right? So if you read the problem statement that used car buyers struggled to balance the macro level research, you know, versus the micro level research, combining market reputation, the hidden vehicle reports, the dealer reviews and live pricing requirements and bring all that in, it leads to an analytical paralysis and high risk decision-making. That's the problem today, right? That's what, and the solution is. It took some time to write this up. Man, that's awesome. And the solution is here. I've described the solution. Then I wrote up some, came up with some high level, and this is still rough stuff. The high level acceptance criteria. Now, I didn't get a chance to send you whenever I started doing some research on the products that are out there. And I got some interesting results from that. If you want me to, I could share my screen. So I think that's really going to be the telling tale. Okay, I'll incorporate all this in today, in a few minutes. Yeah, I don't know if it's, do we incorporate it into the current solution or do we start over? No, it'll overlay. Oh, so it'll build onto what's already there and not get confused. We should keep what we have. It'll overlay it right. And I even got the new cars in there that you said, not just old cars. I got new cars in there too. So it says that you've disabled screen sharing. Yeah, let me switch. What you gave is like a high level PRD prompt that we love. And we like to enhance those. AI loves it. Yeah, and AI should be able to consume it once you explain, you know, that this is the agile process. This is our agile definition because it's going to understand what agile is. And then it's going to better understand what we're trying to accomplish. But the thing I wanted to share that I hadn't sent to you yet was this initial, this initial research that I did, which I found very interesting. So let me know if you see my screen. Yes. Okay, so I basically asked the question, is there currently an AI tool or product that accomplishes this comprehensive research to assist used car buyers? So Gemini comes back and says, no, there's not, right? Now it goes through and it talks about products that are out there like Copilot AI, CarGurus, Microsoft Copilot, Cargenic, AutoAdvisor, CarEdge. It also gives us a table of the current market gap between what we would do and what's out there in the market. But the most interesting thing I wanted to point out, all this other stuff is interesting, but the most interesting thing is this note right here. Because car listing sites make money by selling user leads to dealerships, they are fundamentally disincentivized to show cons or warn buyers about bad VIN histories. By building a tool strictly for the buyer, your product gains an immediate trust advantage that mainstream sites like CarGurus and TrueCar cannot easily replicate without angering their paying dealership network. So the question then comes up, where do we make the money, right? So this right here is really- I have another question, like, where's the money at? Is the money in the quantity of customers or the few dealers that have funds or some other third party that we're not thinking of? Yep. Yeah, well, yeah. And I don't know, like the other background that we talked about, Ian, was the fact that I don't like buying used cars. I was helping my granddaughter do something I don't normally do and leaned on AI to help me do it. And if there was an automated way of doing that and also leverage some of the private VIN records, private information located in VIN records to add to the evaluation, it would have been a far easier process and it would have been a lot less risk. So anyway, I thought this was interesting, this little strategic product note. How can we make the product stand out, right? I think that's what we're trying to do. So the product would stand out based on this table here. The fact that we have a unified score that merges the general trim line data, you know, as well as the private VIN records into a single compatibility score. And it would also translate, common sense translation. It would also say why buy it and what to watch for. So the other thing that I came up with that from whenever I was searching cars, I'll give you another example. This is from my search, for example. If you can send all that to me, I can use that. It says, for example, whenever I was searching a car with certain criteria, what AI was coming back with. It says the Mazda 3 is highly regarded in this budget. It avoids pricing premiums of Corolla that matches its reliability. Why buy it? Fun to drive, sharp styling, highly reliable. And it goes into plain text details. So AI is capable of coming up with plain text response. Like the Pontiac Vibe. I thought that was an interesting one. Why buy it? The Pontiac Vibe. You would think that's crazy, but it says underneath the Pontiac badge, the Vibe is entirely a Toyota Matrix. The same frame, same engine, same transmission. Right. You know, so this AI was able to get this off the internet and provide it to me. So if we had a tool that brought not only the score together, not only the dealership, whether they're a good dealer or not, it's also going to see this information and bring all that to the table for like the top three or top five that meet the buyer's criteria. But anyway, I just wanted to throw that out there. This stuff here I have in this notepad is actually what I captured as I was searching for a car for my granddaughter. Yeah, if there's no classified information there, can you send it to me? Yeah, sure. That'll help me make it better. Yeah. Go back to the one you pointed out at the very bottom, that note. Yeah. So I'm thinking about how we could incentivize our consumer going to that platform. Ian, would it be possible to highlight what is different from what we're showing on the app? Meaning, let's say we have a hundred cars, all those cars pass a certain, like threshold or guardrails that we set for our website that does not meet the standards of all those other like. Yeah, it's like that validation we do on emails. Right, right. But yeah, compare it to like, oh, here's Mazda X. Look, they have 120 more cars, but 120 of those cars are not reliable. Or you know what I mean? Like. Yeah, flags, red flags on them. Red flags, right? Because we'll show all the red flags already, right? It'll say, okay, these are the ones that. Yeah, this dealership only has 10 out of its 200 cars. Right, right. Like, so for example, like we say. Or even if it's off standards before. These are the cars in your zip code that are clean. Now, these are the dealers that are showing the same cars that are clean, but these dealers show other cars that they don't tell you about that are unclean also. Right, you know what I mean? Yeah, even added private sellers onto that list. Right, right. So it gives you like reputable dealers. Now dealers that are reputable may sign up for us, sign up with us and say, hey, we just want to sign up with you because it gives your stamp of approval that yes, we are reputable. Right? Yeah, that's pretty good. Yeah, and that was a thought that I had as well. So that's a good thought. The other thought that Ian and I had in our previous discussion was, if we got a mature product here, what if we were to sell that product, the solution to say CarGurus or Carfax as a premium feature of their product that not only just gives you the information, but we'll go out and search a car using their own information. Right. You know, then instead of us being an external tool, we would sell it as a premium feature that they could sell whenever someone wants to get a Carfax on a car. Well, you could sell a premium feature where for a hundred dollars, for example, Carfax will help you find a car and use all the statistics to help you. Right. Now, are people gonna be willing to pay a premium to do that? I'm not sure. But I do know that whenever you buy a used car, you're taking a big risk. Now, this isn't gonna eliminate the risk, but this should drastically reduce the risk. So that was another thought, Ray, was whether or not this is something we could market to someone who already does the VIN number information, the private information, like CarGurus or Carfax. Yep, right. And they could offer it as a superior or a premium feature of their product line for customers who are already buying this, buying their solution. Yep. No, I agree. So, yeah, I'm not sure. Again, this came out of nowhere this week, right, Ian? So I could send you all this information I got. I'll send you the Word document and that text document I use for searching for cars to time with my granddaughter. And that's why in the feature, I actually, if you go up here into the feature itself, I actually say, you know, let's see. Yeah, because I'm looking at you making, I don't know if you heard of Mac. Right here, you know. Dealer reputation and plain text English, why buy it and what to watch for. Just like Jim and I gave me when I was searching. Why buy that car? And what should I watch for with that car? We're thinking about

making a micro- It's not gonna give us a hundred cars. It's not gonna tell us what cars not to buy. It's only gonna focus on three to five cars that we should be looking at that fits that customer's preferences. We were looking at making a micro drama of the experience you had with you and your daughter as a commercial and then have the solution at the end. Like the problem solution, like how you have it set up. Yeah, the problem statement, customer solution, acceptance criteria, but kind of in a drama. So if you look at CarGurus here, now CarGurus gives you information and the customer can pick the make and model. We should be able to do the same. What price range? We should definitely do that. Mileage, what mileage you're willing to go to, if you wanna scroll it down. So all this stuff that CarGurus does, I'm suggesting we do the same, but CarGurus is doing this for the dealer, not the buyer. I want a solution that does it for the buyer. I'm thinking of, because remember, Ian, I developed that, this is just thinking out loud here. So I developed this one application, but it's more about betting, sports betting. That sports betting application has analytics that pulls different betting sites to tell you which betting site gives you the best odds to win for the team that you like. So what I mean by that is what if we gamify this, that nobody's done that yet in the car industry. So when you click on this car, you already have an idea like, oh, this is like a top buyer. And then when you click it, it tells you the reasons why we made it a top buy. I mean, a lot of these CarGurus, they already have that, but they only go beyond reputation of the dealer, like the mileage it has. But what I'm thinking about is like, what if we add additional things? We pull in information from, because even the same car, different year, could be a bad car. So we could add that, but nobody does that. Like people would think it's a Toyota 2023. It's probably as good as Toyota 2020, but 2020 could have really bad problems on a Toyota of the same car. You know? And that's exactly what happened in my use case with my granddaughter. So we were looking at it. So Jim and I was basically driving us in the direction of a Hyundai Elantra, which I would not have normally looked at. 2011 do not get a newer model than the 2011 right. Oh it went into Jim and I went into a detail of you know, Hyundai in 2007 started wanting to compete more with Honda. So rather than just build a cheap vehicle They started building better vehicles in 2007, but in 2012 Hyundai went to a CVT transmission, which was highly unreliable and cost a lot of money, right? So, why don't we add that? 2010 is good. So it explained all so if we had a tool that gave all that information for the test three results It's not just not just this is just as good deal. Okay, that's strictly off the model and Bluebook price that's that's it and we'll also get so whenever I went to the dealership to look at the car They gave I requested the car actual Carfax and there was a Carfax report That was like 12 pages long of all the oil changes the state inspections the fact that the timing belt was replaced recently all that stuff was in Carfax so what what Ian and I were talking about if all that information was already combined if our Solution would go out and get that VIN information. What has this car been well maintained? Yeah You know that that that's what the macro and micro part of the solution is the macro part is model Make and everything else that ever every car in that that model class Experiences, but then for this car specifically, what does the VIN number tell us? Was it involved in an accident? Has it been getting regular maintenance? You know, so the VIN number gives once I got the Carfax report it had a ton of information Now none of these sites use that information. None of them. Nope That's what I'm saying. Like you you want to make the the site stand out and you could you could include these additional analytics Without that it would it wouldn't it'd be a waste of time right because it would just be like any other site It would just be just like this so we would stand apart and and I guess what the warning from from the The strategy here at the bottom was that that these other websites make their money from the dealers and The dealers don't want to admit that their VIN history suck Yeah, but we somehow we would need to make this so that we make money from the private sellers Right, right because a private sellers or sell it to the Carfax, right? Right. Yeah, we don't want to well we could still sell it to the dealers if that dealers really reputable They would show up here right and they would sign up with us Like what we mentioned like, you know, like oh we're we're not gonna give your sticker of approval if you don't meet our Quality standards here that you're not you're not producing these VINs that are like you shouldn't be selling Yeah, so there's another whole layer that we're not even considered yet Which is whenever a car whenever someone trades a car in with a new car dealership It looks like it goes into a central clearing house Where all the used car dealers along the coast go out and buy the cars What if they what if we provided them with a tool to pick out the VIN numbers that's in that in that in that clearing house so that they could buy the cars that they can justify selling I think that would I think that's a good I like that because now That's kind of like an industry Secret I feel like that's what it is, right? Like you're giving you're giving them that but then that's also valuable like later on to consumers goes Hey, I want to pay subscription to that like we ended up paying a higher price at the top end of the price range for a Honda Elantra in that year class because Of all of this because of all the the records and the fact that everything was clean now the other thing the vent the the car facts indicated was The person who owned the Honda Elantra had sold it and he traded it in for a new car Honda apparently and the Honda dealership let it go to a what looked like a clearing house where the the used car dealership in Virginia Beach bought it from them and brought it down to Virginia Beach to sell it because it was they could get more money in Virginia Beach than they could where the Car was located. So I mean maybe that's another customer class, you know that you know These the I don't know what these used car dealers are using to go out and look for these cars in this clearing house Right But but again, I think The blind spot the spot that's not that it you know There's not a tool for the for the buyer to make these decisions other than just showing them an inventory But yeah, there's another wild card so We were we're throwing around an idea of creating a private investigator So, what if we had a way to call up all the previous owners to find out their satisfaction give them a gift card for answering the questions, I Don't know if that information is available though No, we call them directly Yeah, how would you how would you call them from the information? Where would you get the information on who? well, all of the titles have Oh You're saying there's somewhere else that the information is stored. Yeah. Okay. There's a title like the DMV Yeah Okay, yeah, and if we can call the previous and we don't have to call the AI can call them and give them a gift You know, we have a gift certificate. We want to give you Whatever just to get them to open up and tell them what their experience was in the car Little things like that So I the way I look at this we have to we have to take a layered approach The first thing is can we match what car gurus does and then can we take it that extra step with the micro? Information and the macro information and actually give it a score You know I'm saying right because I do use that. I Use that filter to say great value or something like that in car gurus, right? I Start with that and then I start I start going down the line, you know, okay now it's less mileage I go to that filter, you know Yeah, it would be good to have like like I said like a filter that sets us apart because what I'm thinking is like Even if a car has low mileage, it's a Lexus And whatnot, but then you still say that it's not a good value people are gonna click on that. Why right? It's like right. Hey, I want to buy this but then they're gonna go Oh, I'm glad that I clicked on that because you told me oh, it's because it's been in a wreck or it's been here Well, yeah, you see the other the other challenge that we're gonna have is somebody may be very specific about what they want I only want a Honda Civic. I only want a 2016 Honda Civic right and we come back and we say well a 2016 Honda Civic is really not a good deal. Do we go ahead and say what's the best Honda Civic? 2016 that's out there and then as a side note say, you know, you should really consider this other car instead But if you want the best Honda Civic 2016 go for it You know, I mean And the other thing would have to advise our customers is the more narrow you make your filter the less likely you're gonna get a good result in other words if all you want is a 2016 Honda Civic and If a Honda Civic has transmission issues with the 2016 model you want us to recommend a Honda Civic to you, right, right And another thing that does I don't know if they've added it yet. Um You're limited to the filters that they provide right on these a lot of these tools like I want to look at great Exactly, right, right. Yeah, I think you know I think that I was thinking about that too that we don't need to have all those buttons, right? It could be more plain. We could be more plain text like I want a v4 automatic transmission Right and rather than building all those buttons Yes, they have both that website was built in the days before AI probably or or let's say you're you're like a new You know your father or mother that has a new driver Like I have a 15 year olds about to start driving give show me the car said they should be driving, you know, exactly Yes, exactly. Yes, like it'll just say here's the here's our criteria of why you should buy this is cheaper on insurance It's safe. It's this it's this like right I will just tell you that right you like you're almost like you're telling me like what you were telling me You're leading them to

buy the Honda Civic, right? And then it'll go out and say, okay if I want to buy the car you're telling me is good for my 15 year old daughter What are some good used cars out there in this price range for that car? But but see this is gonna be a little bit unscrupulous but when you have some of those paying like vendors on the back end that's that's paying us our app our our Prompts starts to go towards them now as well. You don't I mean like like the cars that they're selling, you know Hey, but hey, that's I mean, that's that's what you're trying to do, right make money off of an app, you know Like those prompts you think it's really like not filtered it does get filtered just whoever's the highest paying Vendor on the back end of car gurus. They probably should list their sites more than the the lower paying ones You know what? I mean? Well, yeah, they pay Google to have whenever you search use cars a car guru shows up, right? Exactly. I mean they have a relationship. So again breaking into the market's going to be tough. There's going to with this solution. The other disadvantage of this solution is used car dealers are typically unscrupulous. Yes. And aren't necessarily selling people usually get rid of their cars because there's something wrong. So I mean, trying trying to make money on it. That's, that's the tough one. I only brought this up to Ian, not because I thought there was a lot of money out there. But because I saw a gap. And I don't know if there's a way of making money on it or not. But that, that whenever I was searching, I did not find. I did not find a tool that brought all the information together that's out there. It brought together what the dealers want you to know. Rather than what the buyer wants to know. Yeah, I think this this, if it has the features that we're talking about added into the app, and then you, you sell, you don't sell it, you pretty much advertise it as a free app and put it into like Instagram. But the real, the reason why is like, it gets noticed, you get a lot of hits, and you just gets out there. And then after it gets out there, then you start asking for, okay, how am I going to put some money, money around, like subscription businesses will take, right? Well, yeah, you may make money off like used off car repair shops and say, Okay, well, why people are looking, we'll put your car repair shop up there. Because obviously, people buying a used car needs no car repair shops. And maybe they would pay us money to put to have our though their ads show up as the customers are looking for cars just like any other website. Because I remembered 20 plus years ago when Carfax was small. And I'm going like, Oh, when is what is this new app? It took them a long time to get big. Yeah, it did. But But again, to look up to look up a car, I would have had to pay. It's either 45 or \$49. Right. But that was every car. It came out of Circuit City and Circuit City went out of business. Right. And that was a big deal back then you go, Oh, yeah, I want to do that. I want to pay 39 bucks as opposed to like, buying like a junker, you know? So yeah, and but again, that's for one car, right? We're suggesting is we're going to scrape an industry, the area may have say 500 cars that meet your criteria, we're going to scrape all that information and tell you what the best three are to look at. But we I wouldn't be surprised if Carfax itself resells their own data subscription. Right? And well, that that's the catch. Do we have to pay a subscription to get the the specific car details from Carfax? Would we have to build a relationship with Carfax or car gurus to get that information? I think we would. And I think we would too. It's just and without that, I don't know that we can actually can satisfy our long term, you know, that the end goal would not be satisfied without the car specific VIN details. Correct. Right. So if we were able, if we got this to a certain point, and then and then promoted it to Carfax as a partnership. Initially, they may be interested in give us a subscription deal, you know, and say, we'll give you an unlimited subscription for X number of dollars. Or they may say, I really like that. What if we were to buy this from you? Yeah, no, no, I and I are always talking about that where you disrupt a company, you know, that they take notice of you that they would just rather buy it than compete with you. You know, right, right. So yeah, and so I'm all new to this effort here. And I don't know if Ian explained, but I'm a network engineer that worked in product development for Broadcom. So I'm not a software developer, designer or an AI guru. Oh, yeah, but that's good that you understand the marketing side of it, then, you know, I mean, on the product side, which is, yeah, typically, when Ian and I talk, we're talking more about the network side of the house and my experience, you know, and network observability and things like that, that I've worked in for a long time with Ian. And I can't believe you're calling it Broadcom. Now that we used to call that CA. Yeah, it was CA. And before that, it was net QoS. Right, right. You know, it's like, Oh, man, like, what is it going to be now in 10 years after Broadcom, right? Well, the funny thing is Broadcom is getting ready to discontinue the DX NetOps that I was a product manager of, and move it into the into VCF. Yeah, they're going to private cloud. And for and force customers, if you want, if you want our monitoring tool, you have to have a VCF environment. Oh, they're gonna say, now they're gonna lose a lot of customers that way. Right. That's from there. There's probably going to be there's probably going to be opportunity for customers who are dissatisfied with the fact that I don't want a VCF environment in my in my network. So I need to go to someone else's product. Why don't we just redevelop it to make it on prem? You know what I'm saying? Yeah, right. For small to mid sized companies. Oh, yeah. I mean, that's a big disruption right there from them. You know, well, Broadcom only does big corporations now Broadcom does not does not sell the Broadcom monitoring solution was far too expensive for anybody but the top 500 companies in the world. Right. So but that does not to say that smaller companies don't have a need. But if a company like solar winds or science logic is smart, they're going to they're going to be picking up picking off those Broadcom customers who don't want a VCF environment. Right. You know what I mean? Oh, yeah. So but you know, that's my background. So anyway, so Ian, I'll send you the Word document that has all this stuff on it. You can parse it how you want to parse it. Yeah. And I'll send you the notepad where I was keeping notes as I was searching for cars for my granddaughter. Cool. And trying to do manually what we're trying to get done automatedly. By the end of the week, I'll have your video commercial. And then I'll put it up. We have social channels on I'll promote it under go getter. So I mean, keep in mind, we have we have a challenge that we have to cross and I don't know how to cross it, which is without the specific VIN details. I don't know that we could do this. Oh, we could test the market. Yeah, I'm looking at it. It costs \$40 per report for like 99 for five cars. There's got to be a cheaper way to get that data. Well, like the dealership I brought the dealership I bought my daughter's car for my granddaughter's car that we got the car from. They advertise as a Carfax partner and I suspect that they just pay for a subscription and they get as many reports as they want. Yeah, if we did something like that, let's say that you wanted to sell your car and we started a dealership for one car and got a subscription. Yeah, we've done something similar. So I'm seeing that they get it all from auto check for \$29 and they're charging like \$40. So I got like 50% markup. So I guess my point is, but it's worthwhile doing if we can't find that. Well, we've we've reverse engineered other companies like we were getting 1000 leads from leads please. We reverse engineered what they do and we're able to do it better. So we can reverse engineer what auto check does to get this information. Yeah, I don't know how they where that information comes from who's third party websites I'm looking at now and auction sites. So there's auction sites that have information on all vehicles. I mean, they don't necessarily have to be auctioned to people. They have a way of checking every vehicle that you bring into the auction. Well, well, and I mean, the Carfax report that I got on the car we ended up getting was literally pages long of Yeah, that's what these are. Yeah, these are hundreds of pages on per car. Okay. Okay. Yeah. So if we can reverse if AI could scrape all that information combined with, with, you know, ratings and reviews from like consumer reports and such and bring that all together, then we then we can make an advice advise customers. We got a Hermes agent that we're about to put was what's the name of the chip? The chips police was the guy's name. Oh, punch punch. What's the other one? Baker, punch and Baker. Yeah. So we're gonna say it sounds funny, but it's crazy. The best is that from chips? Yeah. We got the best. We got the best AI autonomous agents on the market that will work police officers. You're crazy. They'll go out on the internet, dude. Want to put 1000 flight to put 10,000 flight these dudes are going to take off and come so you're saying that you're saying the information that Carfax produces is available somewhere on the internet. I just did a research. Yeah, I'm tracking. Okay. Okay. That's great. This is the same type of research we had to do with these please figure out where all these leads are coming from. Right? Well, that's fantastic. If that's the case, then that solves our biggest hurdle. I think yeah, that was their moat because nobody would ever take this much time to do it. But there's no effort with and with AI. It's a lot easier for us to do than it was when they first created their own solution. The model they just released called mythos one found zero day exploits in BNC Unix that were there for 20 years, right? NPM that everybody uses. They found exploits that were in there for 15 years. So if I gave you a VIN number, you're saying you could search it? We just got Mythos today, man. We put that thing in a loop

and put our agents on it. We could probably do anything. We could probably rewrite Windows and Mac OS operating systems from scratch. Yeah, and it was funny. So whenever I was working with Gemini, it got to a point where Gemini said, this Hyundai Elantra that was for sale, they said, you should not be walking to go get that car. You should be running. Running. Yeah, we'll put that feature in there. We'll say the running feature, right? Well, right here. Well, if they don't walk away at this point. They said, if they try to evade the question, you have to come and see, walk away. We need to put some fireworks on the screen, like run, run, get this now. We'll put that feature on there. I'm trying to find where it made that statement. It said, you shouldn't be walking to this car. You should be running. Yeah. That's hilarious. All right. Here, this generation features the Theta 2 new engine, which is highly prone to, oh no, that's not the one. Okay, I can't find it right now, but I'll send this to you. Yeah, send me the information. We'll incorporate it in the code. But anyway. We'll take our Hermes agents and our OpenClaw agents. Yeah, and then to test it out with the VIN number of the car we ended up buying to see what you find. For example, can you get that same report that I got from Carfax? Hey Ray, my twins are going to be called Mandalorian and Grogu. That's awesome. Grogu is going to be Mythos. Is it already out, really? I haven't upgraded it. It came out a few hours ago. Yeah, I haven't upgraded yet. That's the one that gets zeroed to hacks and every piece of software has been out. They haven't released it. They didn't release it since January because they had to fix all these holes in the internet. Now that everybody's red team didn't fix most of the flaws, they're releasing it to the public today. It still has a harness on it that will prevent you from doing anything like hacking and stuff until- Oh, okay, so they dumbed it down. Yeah, they put an extra mask on it until the end of the month. You'll see it when you bring it up. It's crazy. All right, I don't want to hold you guys. Okay. Well, thanks, Ian. Yeah, nice meeting you. Nice meeting you, Ray. Awesome. All right. Okay, I'll talk to you guys soon. Okay, bye-bye. Okay, bye.
